# 1. Release Notes

This document provides the new features, installation and upgrade notes, known issues, and workarounds that apply to release 25.3.0 of OpenText™ Static Application Security Testing

This information is not available elsewhere in the product documentation. The user guides for this product are available on the Product Documentation website:

<https://www.microfocus.com/documentation/fortify-static-code/>

## 1.1. Fortify product name changes

OpenText is in the process of changing the following product names:

**Table:** Product name changes

Previous name	New Name
Fortify Static Code Analyzer	OpenText™ Static Application Security Testing (OpenText SAST)
Fortify Software Security Center	OpenText™ Application Security
Fortify WebInspect	OpenText™ Dynamic Application Security Testing (OpenText DAST)
Fortify on Demand	OpenText™ Core Application Security
Debricked	OpenText™ Core Software Composition Analysis (OpenText Core SCA)
Fortify Applications and Tools	OpenText™ Application Security Tools

The product names have changed on product splash pages, mastheads, login pages, and other places where the product is identified. The name changes are intended to clarify product functionality and to better align the Fortify Software products with OpenText. In some cases, such as on the documentation title page, the old name might temporarily be included in parenthesis. You can expect to see more changes in future product releases.

## 1.2. Fortify documentation updates

The following documents will reflect changes that enable us to release products more often and with fewer dependencies on other products in the Application Security (Fortify) suite.

Document	Change
OpenText™ Application Security Software Release Notes	This document has been renamed to OpenText™ <Product Name> Release Notes as each product will have its own release notes document.
Application Security Software System Requirements	Rather than publishing a single guide that covers all of the products for a specific release, each product's requirements can be found in the product's user guide.
What's New in Application Security Software	New features will no longer be appear in a separate document. New features will be listed in the product's Release Notes.

## 1.3. New features

The following features have been added to OpenText Static Application Security Testing.  
Platforms

- Mac-ARM platform distribution

Features/updates

- Xcode 16.3 (Swift 6.1, Clang 17)
- Xcode 16.4 (Swift 6.1.2, Clang 17)
- Akka (Lightbend) license for the 2025 Scala translator.

## 1.4. Fixed issues

The following are fixed problems and limitations in OpenText™ Static Application Security Testing (Fortify Static Code Analyzer) version 25.3.0.

- ENG1764381: Issue with snippets, occasionally leading to Audit Workbench showing `No source found` error for IaC and PL/SQL issues.
- ENG1783420: Issue with translating Gradle integration projects with `--configuration-cache` option set in `gradle.properties` by Gradle Wrapper.
- ENG1778125: LOC count mismatch in javascript after upgrading to OpenText SAST 24.4 or later versions.
- ENG1763185: Configuration related to audit information may be lost between scans when an issue just changes line number.
- ENG1763063: Error in C++ projects:  
`fatal error: bracket nesting level exceeded maximum of 256'`
- ENG1761411: Xcode build fails to translate Swift code that results in the following error:  
`swift-translator: error: Swift compiler setup failed: Loading the standard library failed`

## 1.5. Known issues

The following are known problems and limitations in OpenText™ Static Application Security Testing (Fortify Static Code Analyzer) version 25.3.0.

- When running OpenText™ SAST 25.3.0 as a ScanCentral SAST Sensor, the pre-installed 25.2.0 version of the ScanCentral Client will not be able to submit remote translation jobs to the 25.3 Sensor by default.

**Workaround:** Set the `sensor_version_for_all_jobs=25.3` property in the `config.properties` file on the ScanCentral SAST Controller. This will enforce all jobs submitted by any version of ScanCentral SAST Client to be assigned to Sensors using OpenText SAST 25.3.0. Local translation jobs are not affected. Local translation jobs created by OpenText SAST 25.3.0 and submitted with ScanCentral Client 25.2.0 will properly be assigned to Sensors using OpenText SAST 25.3.0.

- Some source files might be missing from the scan of an Xcode project if all targets in the project are not built for the same set of target architectures.

**Workaround:** If you encounter this problem, specify a single architecture for the build by adding the `-arch` option to the `xcodebuild` command that will be run by `sourceanalyzer`. You can also update the build configuration in the Xcode project or create a separate configuration to use for scanning and ensure that the target architecture(s) is the same for all targets.

## 1.6. Notices of planned changes

This section includes product features and technologies that will be removed from a future release of the software. In some cases, the feature will be removed in the very next release. Features that are identified as deprecated represent features that are no longer recommended for use. In most cases, deprecated features will be completely removed from the product in a future release. OpenText recommends that you remove deprecated features from your workflow at your earliest convenience.

- Support for Gradle 6.5 and earlier versions will be removed in the next release.
- OpenText SAST 25.3.0 will be the last version to include the OpenText ScanCentral SAST Client. In future releases, the ScanCentral Client will need to be installed separately in order to run SAST as a ScanCentral SAST Sensor.

## 1.7. Features not supported in this release

The following features are no longer supported.

### Build tools

- xcodebuild 15, 15.0.1, 15.1, 15.2
